

## Ensuring Stable Power Supplies

To ensure stable power supplies, Kyushu Electric Power is developing new power generation facilities to balance supply.

### Optimum mix of nuclear and other power sources

Japan's energy supply structure is more fragile than those of other developed countries. About 80% of Japan's energy resources are imported, and oil accounts for more than half the nation's primary energy.

To offset this fragile structure, Kyushu Electric Power is taking a balanced approach to developing power sources, with focus on nuclear power. Our approach involves maintaining energy security in the face of steadily rising demand, while considering cost-effectiveness and the global environment.

### Ensuring reliable supplies

To provide high-quality power with a minimum of failures or voltage fluctuations, Kyushu Electric Power will continue to improve its operation and maintenance technologies, and will develop more advanced methods of facilities operation and management.
